

I. INTRODUCTION

In 1973, the Alaska State Legislature enacted Alaska's Limited Entry law (AS 16.43) for commercial fisheries. The law provided for the creation of a new agency, the Commercial Fisheries Entry Commission (CFEC), to administer a program regulating entry into commercial fisheries under state jurisdiction. Limited Entry was implemented in most of the salmon fisheries in 1974. By year-end 1994, permanent permits had been issued in a total of 46 fisheries (50 permit types): twenty-six salmon fisheries, fourteen roe herring/herring fisheries, three crab fisheries, and three sablefish fisheries.

A legal prerequisite of the Limited Entry Act was that permits not be locked in the hands of those who were originally issued them (i.e., "initial issuees").¹ After much study and debate, the legislature finally chose free transferability as the method for allowing orderly entry and exit from the fisheries.

Free transferability allows transfer of permits from parents to their children. It also provides for inheritance upon the death of the permit holder, entry and exit of fisheries at opportune times, and obviates the need for an expensive and time consuming bureaucratic process to handle permit reallocation. Free transferability also facilitates permit exchange and promotes overall efficiency. Many other transfer options were considered and were found lacking with respect to these criteria.

In 1983, the Alaska Supreme Court ruled on a challenge to the constitutionality of the Limited Entry Act in general and the free transferability provisions in particular in State of Alaska v. Ostrosky, 667 P.2d 1184 (1983). The Alaska State Supreme Court upheld the constitutionality of both the Act and of free transferability and also affirmed the legislative objectives in adopting the transferability option. The decision was subsequently allowed to stand by the United States Supreme Court when it dismissed the Ostrosky appeal in Ostrosky v. State, 104 S. Ct. 2379 (1984), rehearing denied 104 S. Ct. 3572 (1984).

Despite the benefits of free transferability, many persons remain concerned that permit transfers may eventually result in undesirable consequences with regard to permit distribution. There is a concern that permits will leave the state, or that permits will disappear from isolated fishing communities which are "local" to a limited fishery, thereby eroding the economic base. The legislature has twice ordered studies of transferability options, first upon initial passage of the Act² and again in 1980.³

Because of these concerns about free transferability, CFEC has produced this report so that the legislature, the administration, and other interested parties will be kept accurately apprised of the facts. CFEC hopes to periodically update this report as the budget allows.

This twelfth edition covers the 46 limited fisheries (50 permit types) for which permanent permits had been issued in the period 1975 through 1994. It contains detailed information on transfer incidence, the initial geographic distribution of permit holders, changes in permit distribution due to permanent transfers of permits and migration of permit holders, and the year-end 1994 geographic distribution of permit holders. Extensive information is also provided on the age distribution of permit holders, age differences between transferors and transferees, rates and characteristics of intra-family and business partner transfers, permit price levels, and permit acquisition and financing methods.

II. TRANSFER INCIDENCE

Statewide Turnover Rates

During the period 1975-1994, 14,064 permanent limited entry permits were issued in 46 fisheries. Not all of these permits, however, were available for transfer. AS 16.43.250 required that CFEC develop hardship ranking systems to allocate permits ("point systems"), and determine at which point levels a person would experience only minor economic hardship if excluded from the fishery. Permanent permits issued to persons classified at minor economic hardship levels were to be nontransferable. By the end of 1994, 12,399 permits had been issued as fully transferable.¹ and 1,665 permits issued as nontransferable.

During this same time span there were 20,611 permanent transfers. Original permit holders transferred 8,776 permits, indicating approximately 70.4% of all transferable permits had changed hands at least once (8,776 out of 12,461 permits) by the end of 1994. The average number of transfers per average number of transferable permits was 9.5% (20,611 total transfers / 216,328 total permit-years = transfer rate = 9.5%).

Two types of annual transfer rates are shown in [Table 1](#). The first type is the ratio of the permits transferred for the first time (i.e. from initial issuees) to the number of transferable permits. This ratio would be expected to decline over time if no new permits were issued because each year there would be fewer permits held by initial issuees left to transfer. This transfer ratio has declined from .08 to .02 over the 1975-1994 time period. The ratio of transfers from initial issuees to transferable permit years is .04 for the entire time period.

The second type of annual transfer rate reported in [Table 1](#) is the ratio of transfers to available transferable permits which provides one measure of the annual turnover rate for transferable permits. This ratio varied between 0.07 and 0.13 over the 1975-1994 time period, and averaged 0.10 for all years combined.² As can be seen in [Table 1](#), this transfer ratio dropped below the all-years average in 1989 and has remained relatively low through 1994. The 1993 and 1994 ratios of 0.07 indicate the lowest turnover rates recorded over the time period.

Even though the number of permanent transfers has declined in recent years, the number of permanent permits in that same time period has increased. The reasons for this decline in permit "turnover rates" is unclear; however, it may be partially due to several factors which may have increased the uncertainty about future returns in some fisheries and thereby increased the uncertainty about underlying permit values.

Turnover Ratios by Fishery 1975-1994

Fisheries were divided into groups in [Table 2](#) based upon the year in which each was limited. Summary transfer rates are provided for each group. The first group consists of the original 19 salmon fisheries for which permanent permits were first issued in 1975, the second group consists of the six Arctic-Yukon-Kuskokwim (AYK) salmon fisheries limited in 1976, and the third group includes the four herring fisheries which were limited in 1977-1978. A fourth group includes the hand troll fishery, the Prince William Sound (PWS) and Kodiak herring fisheries, and the Southeast crab and sablefish fisheries which were limited during the 1980-1987 time period. The final group consists of six Westward herring fisheries which were limited during 1988-1991.

Two measures of average annual transfer rates for individual fisheries are shown in [Table 2](#). The first transfer rate is calculated by dividing the cumulative total transfers from initial issuees over the time period by transferable permit-year counts. The fisheries limited in the years 1980-1987 have the highest rates of transfers from initial issuees but this rate is expected to decline over time because each year there will be fewer initial issuees remaining in the fishery.

The second transfer rate is calculated by dividing all permanent transfers over the time period by total transferable permit-year counts. The permit-year count represents a summation over all years of the number of transferable permits existing at the end of each year. These rates are comparable to the all- years statewide summary rates presented in [Table 1](#).

For the second type of turnover rate (ratio of transfers to transferable permit-years), the transfer rates vary considerably by fishery. The transfer rates for about two-thirds of the fisheries are 0.10 or greater when averaged across all years. Some of the fisheries with lower annual average rates are: all of the AYK fisheries except for Norton Sound herring gill net, the Chignik and the Peninsula/Aleutian seine, the Southeast herring seine, and the Southeast king crab pot fisheries.

The annual transfer rate within a fishery may vary considerably from year to year. This is demonstrated in [Appendix B](#) where the number of transferable permits, number of transfers, and the transfer rates for each year are presented for individual fisheries. The yearly number of permanent transfers has been relatively low in many fisheries since 1989.

[TABLE 1.](#) Statewide Transfer Data on Permanent Permits, by year, 1975 - 1994

[TABLE 2.](#) Transfer Ratios by Fishery, 1975-1994, All Years Combined

III. GEOGRAPHIC DISTRIBUTION OF PERMITS, TRANSFERS AND MIGRATIONS

Alaska's commercial fisheries are extremely important to the state's economy, especially in rural communities where fishing provides the major source of employment and income. In this portion of the report, both statewide and fishery-specific information is provided on the effects of permit transfers and migration of permit holders on the permit holdings of each residency type.

Classification of Permit Holders

In order to measure the changes in the distribution of permits, permit holders have been classified into broad categories according to where they reside. Langdon¹ divided a fishery's permit holders who were residents of Alaska into those who had domiciles which were "local" and those which were "nonlocal" to the fishery. He further defined Alaskan domiciles as "rural" or "urban." Non-Alaskans were lumped into a single "nonresident" category.

As Langdon's conceptual categories are a useful way to examine the geographic distribution of permits, they have been used in this report. These resident types and are defined as follows:

Alaska resident of a Rural community which is Local to the fishery for which the permit applies (ARL);
Alaska resident of a Rural community which is Nonlocal to the fishery for which the permit applies (ARN);
Alaska resident of an Urban community which is Local to the fishery for which the permit applies (AUL)²;
Alaska resident of an Urban community which is Nonlocal to the fishery for which the permit applies (AUN);
Nonresident of Alaska (N);
Department of Commerce signifies permits which have been foreclosed upon by the state (DOC) or of the Commercial Fishing and Agriculture Bank (CFAB).

Combinations of these resident types are also used in this report. In some cases, ARLs and ARNs will be combined into a "rural" category; AULs and AUNs into an "urban" category; ARLs and AULs into a "local" category; ARNs and AUNs into a "nonlocal" category; and ARLs, ARNs, AULs, and AUNs into an "Alaskan" category.

The numbers of Alaskans and Nonresidents presented in this report may differ from other CFEC publications (specifically CFEC Annual Reports) because a more conservative residency definition is used. For this report, to be classified as an Alaska resident, a permit holder must have sworn that they are an Alaskan resident on permit renewal or transfer forms, and they must also have provided an Alaskan address. (Annual Reports produce resident/nonresident totals based upon the residency status from the permit renewal form only.)

The decision rules for designating urban and local classifications are described in [Appendix A](#). Essentially the rural/urban distinction is based on a population size of 2,500 or more as of the 1990 census, which is a departure from the 2,000 level used in the pre-1990 editions of this report. Details of the conversion to 1990 census data were outlined in the 1990 edition. Some communities with populations less than 2,500 are classified as urban because they lie on a road system and are within a certain radius of an urban center. For instance, Auke Bay is designated as urban, even though it has a small population, because it is situated on a road system and is within 20 miles of Juneau.

The local/nonlocal distinction is primarily based on the Alaska Department of Fish and Game's salmon administrative areas, with special arrangements for certain inland communities local to fisheries in areas such as the Yukon River and Bristol Bay. A thorough description of local/nonlocal decision rules can be found in

[Appendix A.](#)

The choice of definitions of "rural" and "local" may affect the results of this analysis. For instance, there are 42 Alaskan cities used as resident addresses by permit holders which are defined as urban according to the decision rules used in this report. Ten of these cities had populations between 2,500 and 4,000 as of the 1990 census and are further than 20 road miles from an urban area. These communities are Seward, Nikiski, Kotzebue, Palmer, Unalaska, Petersburg, Barrow, Nome, Homer and Sterling.

If different decision rules had been used which caused these cities to be classified as rural, the number of rural permit holders at year-end 1994 would have increased by 1,191, and the number of rural permits initially issued would have increased by 944. Annual counts of year-end permits held by persons residing in these particular cities as well as in all other Alaskan urban communities are provided in Table 1 of [Appendix A.](#)

Prior to 1978 the resident type classifications are based on the address provided to CFEC by the permit holder during the issuance, renewal and transfer processes. During those early years, some Nonresidents listed an Alaskan address and were classified as Alaskan residents. After 1978, CFEC renewal and transfer forms included a sworn declaration of residency, and resident/nonresident data have become more accurate in later years.

Beginning in 1982, permit renewal forms included space for both a permanent address and a temporary mailing address, but for the 1975-1981 period there was only one address on the form. In some cases, this address may actually have been a temporary mailing address on the fishing grounds and the permit holder could have been mistakenly classified as local to the fishery. The number of fishermen who have been misclassified because of this problem is unknown; however, this source of error appears to be fairly small³ and from 1982 forward temporary mailing addresses should not be a major cause of erroneous resident classifications.

Geographic Distribution of Initial Issues

Hardship ranking systems, or "point systems," based upon past participation and economic dependence were developed for each fishery and used to allocate the original permits. The resulting distribution of both transferable and nontransferable permits among the resident types appears in [Table 3.](#)

Over all fisheries, Alaska residents received 81.6% of the initial allocation of permits and Nonresidents received 18.4% (11,479 and 2,585 permits, respectively) through 1994. Of the 12,399 transferable permits issued, Alaska Rural Local applicants received more permits than any other resident type (6,017 permits or 48.5%). The Alaska Urban Locals received 2,752 permits (22.2%) and the Nonresidents received 2,438 permits (19.7%). Less than 10% of the transferable permits were issued to the combined Alaska Rural Nonlocal (342 permits or 2.8%) and Urban Nonlocal resident types (850 permits or 6.9%).

The percentages of transferable permits issued to the resident types vary widely between individual fisheries or between groups of fisheries. For example, Alaska Rural Locals were issued 39.0% of the 8,012 transferable permits in the group of original I9 salmon fisheries, 80.1% of the transferable AYK salmon permits, 20.1% of the transferable permits issued in roe herring fisheries limited in 1977-1978, 39.8% of the transferable permits issued for fisheries limited in 1980-1987, and 79.7% of the transferable permits issued in the recently limited Westward roe herring fisheries.⁴

By the end of 1994, the distribution of permits among the resident types had changed to the levels shown in [Table 4.](#) Alaska residents held 77.6% of all permits and Nonresidents held 22.4% (10,397 and 3,001 permits, respectively). At the end of 1994, 76.7% (9,553 permits) and 23.3% (2,900 permits) of the 12,461 existing transferable permits were held by Residents and Nonresidents, respectively. Eight transferable permits had been foreclosed upon by the Department of Commerce and Economic Development or the Commercial

Fishing and Agriculture Bank and had yet to be transferred.

Changes in the distribution of permits to assigned residency types includes a 17.2% (1,134 permits) decrease in the total number of permits held by Alaska Rural Locals. At year-end 1994, Alaska Rural Locals held 52.5% of all Resident permits (5,458 out of 10,397) and 40.7% of the total permits (5,458 out of 13,406). Alaska Rural Locals held 53.5% (5,107 out of 9,553) of the transferable permits held by Alaskan residents and 41.0% of all transferable permits (5,107 out of 12,461). Generally, ARLs have experienced the largest percentage decreases of transferable permits in the fisheries which have been limited the longest.

The total number of permits held by Alaska Urban Locals decreased by 449 permits by the close of 1994. A large portion of this decrease was due to the retirement of 412 nontransferable hand troll permits, which were revoked due to the death of the permit holder or because the renewal fees were not paid for two consecutive years. The total number of permits held by Alaska Urban Nonlocals increased by 446 permits, a 48.0% increase, the largest percent change of any residency type. Alaska Rural Nonlocals and Nonresidents also increased their holdings of permits (15.2% or 55 permits, and 16.1% or 416 permits, respectively).

Geographic Changes in the Distribution of Permits Due to Transfer

To examine the geographical changes in permit distribution attributable to transfer activity, transfers have been divided into two groups, one containing transfers between permit holders of the same resident type and the other containing transfers between persons of different resident types. Transfers within the same resident type are termed "intra-cohort" while transfers between different resident types are termed "cross-cohort." Cross-cohort transfers may result in a net change in the distribution of permits among the resident types.

The 20,611 transfers are organized into these categories in [Table 5](#) and the actual numbers of transfers from one resident type to another are presented by year. Percents of the total number of transfers over all years are shown for each transaction type. The majority of all transfers in each year have been between fishermen of the same resident type. The annual percentage of intra-cohort transfers does not vary much on an annual basis and ranges from a low of 59.4% (1988) to a high of 69.8% (1976) and averaged 64.4% across all years.

The percentage of intra-cohort to cross-cohort transfers varies by resident type. Alaska Urban Locals have the highest proportion of intra-cohort transfers (70.4% of their transfers over all years) and Alaska Rural Nonlocals the lowest (38.1). Alaska Urban Nonlocals also show a lower than average rate of transfers to persons of the same resident type (52.5%). Alaska Rural Locals and Nonresidents have similar proportions of intra-cohort transfers (65.9% and 66.2%, respectively).

Information on the intra-cohort and cross-cohort transfers for each fishery, all years combined, is provided in [Table 6](#). With few exceptions, the majority of transfers within each fishery have been intra-cohort.

The cumulative net results of cross-cohort transfers to each resident type, by fishery, are shown in [Table 7](#). Note that if no transfers have occurred in a particular fishery, that fishery will not be listed on the table. By year-end 1994, the following changes had occurred in the distribution of transferable permits as a result of cross-cohort transfer activity:

1. Permits held by Alaska Rural Local residents decreased in about two-thirds of the listed fisheries, which resulted in a statewide net decrease of 728 transferable permits (12.1% of the 6,017 transferable permits originally issued to ARLs). The Bristol Bay drift and set gill net fisheries have had the largest numerical net decreases (351 permits combined) which represent 48.2% of the 728 permit decrease. This 351 permit decrease is 28.6% of the 1,227 transferable permits originally issued to ARLs in these two fisheries. The largest decreases in permits held by ARLs have been in the following fisheries: Prince William Sound drift gill net (73 permits), Southeast salmon seine (57 permits), and the Peninsula/Aleutian drift gill net fishery (54 permits). These decreases represent 21.6%, 53.8%, and 55.1%, respectively, of the transferable permits

originally issued to Alaska Rural Locals in these fisheries.

2. Permits held by Alaska Rural Nonlocal residents increased by 33 permits due to net transfer activity (9.6% of the 342 transferable permits issued to this resident type).

3. Permits held by Alaska Urban Local residents increased by 48 permits due to net transfer activity (1.7 of the 2,752 transferable permits originally issued to this group). The largest net increases were in the Power troll (40 permits), the Kodiak salmon seine (39 permits) and set net (27 permits) fisheries. In contrast, the number of permits held by Urban Locals decreased in 17 other fisheries.

4. Permits held by Alaska Urban Nonlocals have increased by 421 permits, a 49.5% increase over the 850 transferable permits initially issued to this resident type. The number of transferable permits held by Alaska Urban Nonlocals has increased in 32 fisheries, especially the Bristol Bay salmon fisheries (170 permits), the Prince William Sound salmon fisheries (102 permits), and the Lower Yukon salmon gill net fishery (33 permits).

5. The number of permits held by Nonresidents increased by 218 permits statewide through net transfer activity, a 8.9% increase over the 2,438 transferable permits issued to them. The number of transferable permits increased in 22 of the fisheries, especially the Bristol Bay salmon fisheries (192 permits), the salmon hand troll fishery (61 permits), the Cook Inlet salmon set net fishery (42 permits) and Southeast salmon seine (27 permits).

In fourteen other fisheries the number of permits held by Nonresidents decreased, especially the power troll (74 permits), the Kodiak salmon seine (42 permits) and set net (26 permits), and the Cook Inlet drift gill net (19 permits) fisheries.

Geographic Changes in the Distribution of Permits Due to Migration

Other changes in residency patterns of permit distribution occur when permit holders move from one community to another. During the 1975-1994 time period there were 11,182 city and/or residence indicator changes; 5,852 of these resulted in a resident type reclassification and have been defined as "migrations" for the purposes of this report.

Migrations to and from each resident type for both transferable and nontransferable permits are shown in [Table 8](#). In general, there appears to be considerable movement both to and from each resident type.⁵ In 1993 and 1994 there was less migration by permit holders than in recent years, especially since 1988. The net results of migratory activity to each resident type over the entire period are shown by fishery in [Table 9](#). Note that some recently limited fisheries have had no migratory activity and are thus not listed in these tables.

The 1975-1994 geographical shifts in the distribution of permits due to migration can be briefly summarized as follows:

1. Statewide, the number of permits held by Alaska Rural Locals decreased by 243 permits due to migration. Migratory activities did not affect all fisheries in the same manner, however. There were ARL net decreases in 26 fisheries and ARL net increases in 9 others.

The number of permits held by ARLs decreased primarily in the AYK salmon fisheries (112 permits), the Bristol Bay set net fishery (37 permits), the hand troll fishery (33 permits), and the Prince William Sound salmon seine fishery (29 permits). ARL gains through migration were made in the Cook Inlet set net (19 permits), Chignik seine (16 permits) and Southeast drift gill net fisheries (11 permits).

2. The number of permits held by Alaska Rural Nonlocals increased by 30. Fisheries with high numbers of

increases were the AYK fisheries (38 permits), the Kodiak salmon seine (10 permits) and the Bristol Bay set net fishery (10 permits).

3. The number of permits held by Alaskan Urban Locals decreased by 148. The decrease was primarily within the hand troll (41 permits), the Cook Inlet set net (34 permits), and the Kodiak salmon seine (36 permits).

4. The number of permits held by Alaskan Urban Nonlocals increased by 67. Permits held by AUNs increased by 65 permits within the AYK salmon fisheries and 30 permits in the hand troll fishery. However, there were net decreases with 13 other fisheries, particularly within the herring fisheries limited in 1977-78 (28 permits), and the Bristol Bay salmon fisheries (25 permits).

5. Alaska residents who moved out of state resulted in a net increase of 294 Nonresident permits. The Nonresident category shows net changes in the number of permits in 35 different fisheries, 30 of which indicate net increases. The largest net increases in permits held by Nonresidents appeared in the Bristol Bay salmon fisheries (81 permits), the Kodiak purse seine and set net salmon fisheries (56 permits), the hand troll fishery (41 permits), and the Cook Inlet salmon fisheries (42 permits). The Southeast drift gill net fishery was the only fishery where there was a large gain in the number of Alaska resident permits (20 permits).

Summary of Changes in Permits Held by Resident Type

A yearly summary of the net changes in the distribution of permits by resident type as a result of transfers, migrations and revocations is provided in [Table 10](#). The cumulative effects of these changes are summarized below:

1. Alaska Rural Locals were issued 6,592 permits, (transferable and nontransferable, [Table 3](#)) through year-end 1994, which represented 46.9% of all permits. At year-end 1994, 5,458 (40.7%) of all permits were held by ARLs ([Table 4](#)). The decrease of 1,134 permits represents 17.2% of all permits originally issued to this group. Transfer activities account for 64.2% of the decrease (728 permits) followed by migration (21.4% or 243 permits) and revocations (14.4% or 163 permits).

The number of permits held by Alaska Rural Locals declined in nearly every year since 1977. Since 1987, migration of permit holders away from rural local communities has accounted for most of the decrease, whereas before this time transfers accounted for most of the decline.

2. Alaska Rural Nonlocals have been issued 363 permits through year-end 1994 (2.6% of all permits). By the end of 1994, the number of permits held by ARNs rose to 418 (3.1% of all permits). The increase of 55 permits represents a 15.2% increase over the number of permits originally issued to this group. The net increase comes mainly from transfer activity (33 permits) but migration also accounts for much of the gain (30 permits).

3. Alaska Urban Locals received 3,595 of all permits issued through 1994 (25.6% of all permits). They held 3,146 permits at year-end 1994 (23.5% of all permits), a decrease of 449 permits. Revocations of permits have been the major factor in this decrease (349 permits). Most (412) of the revocations have been in the hand troll fishery and were due to either the death of a nontransferable permit holder or the forfeiture of permits for nonpayment of permit renewal fees.

The fact that transfer activities show a net increase in Alaska Urban Local permits is due to large gains in the years 1975 through 1981, 1979 excepted. Beginning in 1982 and continuing through 1994, transfer activities have had a negative impact on the number of permits held by Alaska Urban Locals.

4. Alaska Urban Nonlocals received 929 (6.6%) of all permits issued through 1994. At the end of 1994, the number of permits held by AUNs had risen to 1,375 (10.3% of all permits). The increase of 446 permits

represents a 48.0% increase over the number of permits originally issued to this group. Transfer activities have been primarily responsible for the increase, with net increases shown in nearly every year since 1978.

5. Nonresidents received 2,585 of all permits issued through 1994 (18.4% of all permits). By the end of 1994, 3,001 permits were held by Nonresidents (22.4%). The 416 net permit increase represents a 16.1% increase over the number of permits originally issued to this group.

Annual net changes in the number of permits held by Nonresidents due to transfer and migration have fluctuated widely. The recent net change from 1986 through 1994 has been influenced more by migration (303 permit increase) than by transfer (55 permit increase).

[Appendix C](#) documents initial issuance, transfer, migration, and revocation of permits by fishery and by year for each of the resident types. An in-depth analysis of the movements of permits from Alaska Rural Local permit holders and from the Alaska Local permit holders (combined group of Alaska Rural Locals and Alaska Urban Locals) will be presented in subsequent chapters of this report.

[TABLE 10](#). Statewide Summary of Annual Net Changes in Permit Distribution, by Resident Type, 1975-1994

IV. AGE PATTERNS AMONG PERMIT HOLDERS

A concern of the drafters of the Limited Entry Act was that limited fisheries would remain accessible to younger Alaskans. This section examines age patterns of year-end permit holders, transferors, and transferees over the 1975-1994 time period. Excluded from the data are nontransferable permits and permits which had been foreclosed upon by the Department of Commerce and Economic Development or the Commercial Fishing and Agriculture Bank and had yet to be transferred.

Yearly mean ages for all transferable permit holders, transferors and transferees are shown in [Table 11](#). If no permits were transferred at all, the mean age of permit holders would logically increase by one year each year. However, the mean age actually declined from about 43 in 1975 to 41 in 1977 and continued at approximately that level through 1986. The mean age then began to slowly increase to a little over 44 years at year-end 1994. There are at least two possible explanations for this increase. There have been fewer transfers in recent years (and therefore less influence from younger people entering the fisheries), and the average age of the transferees has increased. During the 1975-1983 period, the statewide annual mean age of transferees was consistently between 32 and 34 years. Beginning in 1984 the annual mean age of transferees rose to approximately 35 years and has gradually increased since then. The 1994 mean transferee age of 38 years is the oldest in the series.

The statewide annual mean age of transferors was highest in 1975 at 52 years, shortly after the first limited entry permits were issued. It then declined to 41 years by 1979, then rose to stay in the range of 43-44 years from 1980 to 1987. Since then, the annual transferor mean age has gradually increased to almost 46 years in 1994.

Overall, the age difference between transferors and transferees was greatest in the early years of the limited entry program, particularly prior to 1978. Since 1984 the overall age difference has not varied much and has averaged between 7 and 9 years.

Annual mean ages for year-end permit holders, transferors and transferees in specific fisheries are presented in [Table 12](#). At year-end 1994, the fisheries with some of the highest mean ages of year-end permit holders were the Southeast All King and Tanner crab (54 years), the Southeast herring seine (53 years), and the Upper Yukon gill net fisheries (52 years).

The Lower Yukon salmon gill net (40 years), the Kuskokwim salmon gill net (39 years), and the Bristol Bay herring spawn on kelp (38 years) were the only fisheries with year-end mean ages of 40 years or less.

The annual mean age of each resident type for year-end permit holders, transferors, and transferees is presented in [Table 13](#). The highest mean age for year-end permit holders in 1994 was for Nonresidents and Alaska Urban Locals (46 years) and the lowest was for Alaska Urban Nonlocals (43 years) which has been the case for many of the years since 1975. At year-end 1994, the highest mean age of transferors was within the group of Alaska Rural Locals (47 years) and the lowest was within the Alaska Urban Non-locals (41 years). Generally, the annual mean ages of permit holders for each resident type changes in a pattern similar to the ages of all permit holders; that is, a relatively high average age in 1975, followed by years of declining average age, then a gradual increase beginning in the early 1980's and continuing through 1994.

Annual mean ages of transferees have also gradually increased within each resident type. Nonresidents tend to be a little older (34 to 40 years) and Alaska Rural Locals a little younger (29 to 36 years). Since 1975 Alaska Rural Locals tend to be the youngest recipients of transferred permits. The mean ages of the remaining Alaska resident types have ranged between 31 and 39 years. At year-end 1994, Nonresidents had the highest mean age of transferees (40 years) and Alaska Rural Locals had the lowest (36 years).

The annual age class distributions of year-end transferable permit holders are shown in more detail in [Table 14](#). The figures in parentheses indicate the yearly percent each age class represents of all transferable permits held by a particular resident type (i.e., a row percentage). The percentage of 21-30 ear olds appears to be generally declining with time for most of the resident types. This decline is balanced by an increase in the percentage of permit holders in the 31-40 year old and 41-50 year old categories, and is probably related to the decreased numbers of transfers in recent years and the increase in the average age of transferees. Mean ages by resident type by year are provided for specific fisheries in [Table 15](#).

V. TRANSFER SURVEY RESULTS

CFEC has conducted a survey of transfer participants since 1975. The survey collects information on the relationship between transfer parties, whether the transfer was a gift, sale, trade or inheritance, and, for sale transfers, the type of financing used and the sales price. The survey has been the sole source of information for CFEC permit price estimates which are used by the Department of Commerce and Economic Development and the Alaska Commercial Fishing and Agriculture Bank for fishing loan purposes.

During the period 1975-1979 the survey was sent to all transferors and transferees, but its completion was entirely voluntary and anonymous. Because many surveys were not returned and because those that were returned could not be tied in with other CFEC data, their usefulness was somewhat limited. Information from these 1975-1979 transfer surveys is not included in this current report, but may be found in the first edition published in 1983.[1](#)

In 1980 the survey was modified, tied in with other CFEC data sources, and made mandatory for the transferee to complete. In late 1983 the survey was expanded to include information from the transferor. Transfer survey results from the 1980-1994 time period are presented in the following tables.

Even though the survey was made mandatory in 1980, strict enforcement of this rule did not occur until 1981. There were 139 transfers in 1980 and 15 transfers in 1981 without completed surveys. Note that in every year some transfers occur and no transfer survey is completed for them, which accounts for the slight differences in the "Totals" columns between [Table 1](#) and the tables in this chapter. The majority of these are transfers that occur on foreclosed permits. Overall, the surveys represent 98.2% of all transfers since 1980 (15,338 of 15,614 transfers).

Relationships of Transfer Participants

Of the 15,338 transfer surveys received during 1980-1994, 39.1% (5,997 surveys) indicated a transfer between immediate family members or other relatives, and 20.8% (3,190 surveys) indicated a transfer between friends or business partners. Permit exchanges between people who appeared to have no pre-existing relationship accounted for the remaining 6,150 transfer surveys (40.1%)([Table 16, bottom](#)).[2](#)

Many individual fisheries differ from these all years' statewide percentages. For example, in the salmon gillnet fisheries in Norton Sound, Kotzebue and the Kuskokwim and Lower Yukon Rivers, and in the Chignik and Peninsula/ Aleutian salmon seine fisheries, most of the transfers have been between relatives. In the Prince William Sound pound fishery, the Southeast sablefish fisheries, the Kodiak herring seine and gill net fisheries, the Southeast and Cook Inlet herring seine fisheries, the Southeast hand and power troll fisheries and the Norton Sound herring gill net fishery, most transfers have been to persons in the 'Other' category.

With the exception of the 1994 season, the percentage of transfers between friend/partners has been decreasing since the 1983 season. The rewording of the 'Friend' category on the survey form to 'Personal Friend' in October of 1983 may be responsible for part of this decrease and may also account for the relatively sharp increase in the number of transfers between persons in the 'Other' category in 1984.

When transfers are organized by the resident type of the transferee, considerable variation in relationship patterns is evident among resident types ([Table 17](#)). Over half of the transfers to Alaska Rural Locals, for all years combined, were from immediate family members and relatives (58.0% or 2,609 transfers), which is almost double that of any other resident type. In the remaining resident types, the 'Other' category predominated.

Permit Acquisition Method: Gift, Sale, Trade, and Other

Under the Limited Entry Act's terms of free transferability, permits may be sold, traded, given away or inherited, thus enabling new participants to enter a fishery. During the 1980-1994 time period transfer survey responses indicated that 59.9% of all transfers were sales (9,182 transfers), 34.5% were gifts (5,295 transfers), and 1.8% were trades (275 transfers). The remaining 584 transfers in the 'Other' category comprised 3.8% of the survey responses ([Table 18, bottom](#)).

The incidence of gift transactions has accounted for roughly 30-40% of all transfers since 1980. Because gifts accounted for only 21.5% of all transfer survey responses in the 1975-1979 time period,³ it has been suggested that the 1980-1994 percentage increase may be a result of regulatory attempts to enforce the leasing prohibition. Thus, some of the 'Gift' responses may actually represent lease arrangements or carry reciprocal expectations.

The volume and percentage of sales transfers dropped significantly in 1989 and has remained below the long term average since then.

Individual fisheries often differ considerably from the statewide averages. While sale transactions predominated in most fisheries, gifts represented at least half of the 1980-1994 survey responses in twelve fisheries. These fisheries were the Lower Yukon herring gill net (88.2%), the Kuskokwim gill net (67.4%), the Lower Yukon gill net (63.6%), the Peninsula/Aleutian seine (61.4%), the Kotzebue gill net (61.1%), the Bristol Bay Spawn on Kelp (58.8%), the Chignik seine (54.4%), the Kodiak set net (53.2%), and the Norton Sound gill net (53.1%) fisheries. The Nelson Island herring gill net (90.9%), the Southeast Red/Blue King Crab (100%) and Southeast Tanner crab (50.0%) fisheries also show high evidence of gift transactions, but with a limited number of transfers to date. Fisheries with lower permit values tend to have higher proportions of gift transactions than fisheries with higher permit values. Some notable exceptions are the Peninsula/Aleutian and Chignik salmon seine fisheries (high percentage of gifts and high permit values), and the hand troll fishery (low percentage of gifts and a low permit value) ([Tables 18](#) and [20](#)).

A breakdown of acquisition methods by the resident type of the transferee is presented in [Table 19](#). Since 1980, most of the Alaska Rural Locals who have obtained permits through transfer have received them as gifts (51.7%). Sales have accounted for the majority of the transfers to each of the other resident types over the time period; however, there has been a general decline in the volume and percentage of sales since the 1988, especially for the Alaska resident types.

Permit Prices

In [Table 20](#), mean and median permit prices are given by fishery and year for permit sales during the period 1980 through 1994. Surveys that indicated permit prices of less than \$500 have been excluded from the computations.⁴ To preserve confidential data, price statistics are not computed for fishery/years where less than four sales transactions occurred; also, no value will be reported for a permit/year if there were no sales transactions for that permit. All of the prices are in nominal dollars which do not reflect adjustments for general price inflation.

Permit prices for the same gear type used in different areas of the state vary greatly ([Table 20](#)). For example, the median price of salmon drift gill net permits varied in 1994 from \$61,500 (Southeast) to \$324,500 (Peninsula/Aleutian).

Generally, nominal permit prices of individual fisheries over the 1980-1994 time period have tended to increase through 1990, then fall from 1991 to 1994, especially in the salmon fisheries. Some fisheries show permit prices that have been especially variable over the time period; notably, the Prince William Sound salmon seine, the Cook Inlet salmon drift and set net, and the Cook Inlet roe herring seine permits.

In contrast, permit prices for several fisheries have remained fairly stable, especially in the hand troll and AYK fisheries. Other permits tended to rise in value over the time period; for example, the permits for the Peninsula/Aleutians drift gill net and the Kodiak and Peninsula/ Aleutians set gill net fisheries.

Financing of Permit Purchases

Transfer survey information on sources of financing used for 9,182 permit purchases is presented by fishery and year in [Table 21a](#). Beginning with the 1990 edition, additional data has been utilized from surveys in which more than one finance method was indicated. The decision rules used in analyzing these data are listed at the end of this chapter.

Statewide, self-financing of permits has been the predominant method of finance, accounting for 56.1% of all purchases during the 1980-1994 time period (5,148 permits). The next most important source of financing has been the Department of Commerce and Economic Development's loan program with 19.4% (1,781 permits).⁵ Transferors financed 12.0% (1,102 permits), banks and other private lending institutions financed 7.9% (721 permits), the Commercial Fishing and Agriculture Bank for 2.5% (227 permits), and processors financed 1.3% (121 permits) of the permit purchases.

The remaining 82 (0.9%) survey responses which indicated multiple finance sources were placed in the combination category. Examination of the finance methods by fishery from these 82 permit purchases reveals that most finance sources used were evenly distributed ([Table 21b](#)).

Both the percentage and the number of permit sales financed by the transferor have declined significantly since 1980 ([Table 21a](#)). In 1980, 143 transfers were financed by the seller (27.9%); in 1994 only 40 transfers were seller-financed (8.0%). The percentage of self-financed purchases has tended to increase over the time period and the percentage of sales financed by the state Dept. of Commerce appears to be decreasing since the high in 1982.

Many individual fisheries deviate from the statewide percentages, as shown in [Table 21a](#). For example, fisheries in which the all years' percentages of self- financed permits are higher than the statewide percentage tend to be those with lower permit values, especially the hand troll fishery (87.6% or 909 purchases) and the six AYK salmon fisheries, which ranged between 71.3% and 86.8%.

State-financed loans were the principal means of financing in several fisheries: the Southeast and Prince William Sound roe herring seine (54.5% and 43.8%, respectively), the Chignik and Cook Inlet salmon seine (43.3% and 47.1%, respectively), and the Prince William Sound herring seine (43.8%) and gill net (35.7%) fisheries. The Southeast King and Tanner crab fisheries also show indications of high use of state financing, but the fisheries have recorded only a limited number of sale transactions to date.

Sources of permit financing by resident type and year derived from the Transfer Survey are provided in [Table 22](#). The most commonly used methods of financing for the 6,410 permits purchased by Alaskan residents were the personal resources (Self/Misc.) of the transferee (51.0% or 3,268 sales) and State of Alaska authorized loans (27.7% or 1,773 sales). Urban Alaska residents have received approximately two-thirds (1,176 of 1,773) of the state loans. Nonresidents have the highest rates of self-financing (67.8%) and of financing through the transferor (17.7%) of the permit.

Finance source data from 1980-1994 have been re-evaluated using this new information in the following manner:

- 1). Survey respondents may mark 'Other' on the survey form if they feel that their source of financing does not fit into the categories of: personal resources, State DOC loan, CFAB loan, other bank loans, transferor, or processor. A review of the comments associated with the surveys marked 'Other' revealed that a large number

of these involved unique methods of self-financing or loans from relatives or friends. Because of the strong association of the 'Other' financing with that of the personal resources financing, those responses were combined and classified under a new Self/Misc. category thus eliminating the non-descriptive 'Other' category for the purposes of this report.

2). For surveys where two finance sources were indicated but one of those sources was Self/Misc., the finance source reported in subsequent tables of this study is that of the alternative finance source (other than the Self/Misc. category). The self-financing associated with permits financed by multiple methods is primarily in the form of a down payment or interim financing. The Self/Misc. category is intended to be representative of permit purchases that are primarily financed by personal resources rather than simply purchases involving a down payment (many financing methods involve a down payment).

3). Surveys involving three finance sources as well as the remainder of the two finance source surveys (i.e. those surveys that did not indicate Self/Misc.) are reported under the category of 'Combination' financing in subsequent tables of this study. The components of these combination- financed permits are reported in [Table 21B](#).

VI. PERMIT TRANSFERS FROM ALASKA RURAL LOCALS TO OTHER RESIDENT TYPES

The long term effects of limited entry on rural communities dependent upon fishing have been of considerable interest to the legislature, the administration and the public, and the degree to which limited entry permits have been transferred away from these communities has been a matter of concern. Since 1975, about two-thirds (66.2%) of the 6,662 transfers made by Alaska Rural Locals have been to other Alaskan Rural Locals. This percentage has been relatively consistent, ranging from a low of 60.8% in 1982 to a high of 72.6% in 1994 ([Table 5](#)). The remaining 33.8% (2,254) of the transfers have been to other resident types (cross-cohort transfers). This section will present information regarding only the cross-cohort transfers from Alaska Rural Local residents.

In every year except 1975 and 1990, cross-cohort transfers by ARL's have resulted in a net decrease in ARL-held permits -- in other words, ARL's have transferred more permits to other resident types than other resident types have transferred to them ([Table 23](#)). Through 1994, this cross-cohort transfer activity resulted in a net decrease of 728 transferable permits held by Alaska Rural Locals. Statewide, the number of permits held by each of the other resident types increased through these ARL cross-cohort transfers as follows: Alaska Urban Nonlocal permits increased by 322, Alaska Urban Local permits increased by 85, Alaska Rural Nonlocal permits increased by 35, and Nonresident permits increased by 266.

From 1977 through 1986 (with 1985 excepted), net decreases of Alaska Rural Locals ranged from 52 to 92 permits per year. Since then the annual net decreases have been much smaller.

Net transfer activity of Rural Local permits is presented in [Table 24](#) for each fishery, all years combined. The same data is presented in [Appendix D](#) by fishery and year.¹ The Bristol Bay drift and set gill net fisheries have had the largest net numerical decreases in rural local permits due to transfer activity (199 and 152 permits, respectively), which represents 48.2% (351 of 728 permits) of the statewide ARL net transfer decrease.

While the Bristol Bay fisheries have had the highest numerical decreases in the number of permits held by ARLs, other fisheries have had larger proportional decreases. For example, the ARL net decrease of 57 permits in the Southeast salmon seine fishery represents 53.8% of the 106 ARL permits originally issued ([Table 24](#)). Other fisheries with net decreases greater than 25% of the number of permits initially issued to Alaska Rural Locals (and with more than 5 initial permits issued to ARLs) are the Peninsula/Aleutians drift gill net fishery (55.1%), the Southeast sac roe gill net fishery (50.0%), the Cook Inlet sac roe and salmon seine fisheries (33.3% and 32.4%, respectively), and the Kodiak beach seine and set net fisheries (30.8% and 25.0%, respectively).

[Table 25](#) provides information concerning the relationships between transfer parties for 1,655 Alaska Rural Local cross-cohort transfers that occurred over the 1980- 1994 time period. The information comes from the CFEC transfer survey. As might be expected, most (61.3%) cross-cohort transfers of ARL-held permits were between persons who had no previous relationship; however, the Kodiak salmon and herring fisheries, the Yakutat and Peninsula/Aleutians set net fisheries, and the AYK salmon fisheries all show relatively high rates of transfer to friends or relatives. Note that by definition, those persons would be of a different resident type than ARL.²

The acquisition method used in permit transfers from Alaska Rural Locals to other resident types for the 1980-1994 period is presented in [Table 26](#). As might be expected, most (80.0%) of these cross-cohort transfers were sales (1,324 of 1,655).

Transfer survey information on financing methods used in the permit sales from Alaska Rural Locals to other resident types is provided in [Table 27](#) by fishery and year. The predominant source of financing has been the personal resources of the buyer (61.2%), especially in some of the fisheries that show lower permit values such as the hand troll (93.6%) and AYK salmon fisheries (71.4% to 81.8%). State-financed loans are also an important source of financing for buyers of permits held by ARLs (17.9%). These figures differ from the Alaska resident totals in [Table 22](#) and suggest that other resident types who buy ARL-held permits tend to rely more on self-financing and banks and less on state loans than do Alaska residents as a whole.

The survey information also indicates that since 1984 there has been a sharp decrease in the number of sales of ARL-held permits which have been financed by the seller. In the years 1980-1983, approximately 19.3% of the sales were financed in this manner while in the years since 1984 only 5.1% were financed this way (44 transfers).

VII. PERMIT TRANSFERS FROM ALASKA LOCALS TO OTHER RESIDENT TYPES

Local Alaskan permits, which are the combined permits from Alaska Rural Local and Alaska Urban Local resident types, are the focus of this section. Alaska local permits are defined as those held by persons who reside in the area near a limited fishery. Tables similar to those in the previous section on Alaska Rural Locals are provided on the transfers between Alaska Local permit holders and other resident types.¹ In every year since 1977, the number of permits held by Alaska Locals declined as a result of transfer activities with the Nonresident and Nonlocal resident types ([Table 28](#)). Over the 1975-1994 time period Alaskan Locals transferred 2,535 permits to other resident types. Alaskan Locals received 1,855 permits from other resident types which resulted in a net decrease of 680 locally held permits. Total net decreases were greatest in the years 1979 through 1986.

The corresponding net increases within the other resident types were 344 permits to Alaska Urban Nonlocals (50.6%), 278 permits to Nonresidents (40.9%) and 32 permits to Alaska Rural Nonlocals (4.7%). Transfers to the Department of Commerce or CFAB through loan foreclosures and subsequent resales by these agencies have resulted in a net decrease of 26 (3.8%) permits from Alaska Locals.

The cumulative numbers of transfers to and from local permit holders are presented for each fishery in [Table 29](#) and by fishery and year in [Appendix E.2](#). By the end of 1994, the number of permits held by Alaska locals decreased in 28 of the 41 fisheries that showed net changes in cross-cohort transfer activity.

Numerically, the greatest decreases in permit numbers have been in the Bristol Bay fisheries (351 permits), the Prince William Sound salmon fisheries (113 permits), and the Peninsula/Aleutian fisheries (84 permits). The Bristol Bay fisheries alone accounted for 51.6% of the 680 net decrease in the number of permits held by Alaska locals. The net local shift in these fisheries was highest in the late 70s and early 80s but this shift has been reduced in the 1988-1994 period ([Appendix E](#)).

Of the few fisheries that marked net increases in permits to Alaska locals, the power troll (66 permits), Cook Inlet drift gill net (22 permits), and Kodiak seine (24 permits) fisheries showed the largest numerical gains.

Transfer survey information from 1980-1994 describing 1,902 transfers from Alaska Locals to other resident types is provided in [Tables 30-32](#). The relationship between transfer parties by fishery and year is presented in [Table 30](#). Statewide, survey responses indicate that 63.7% of the transfers from local residents to other resident types during the 1980-1994 period were between people who had no pre-existing relationship (1,211 out of 1,902).³ Since 1984 the range of this percentage has been from 62.2% to 71.7%, except in 1992 when it rose to 83.8%; however, the Yakutat and Kodiak salmon set net fisheries, and the Upper Yukon gill net fishery all show relatively high proportions of transfers to friends and relatives in these cross-cohort transfers ([Table 30](#)).

Transfer acquisition methods are presented in [Table 31](#). From 1980 to 1994, the majority of the transfers from Alaska Locals to other resident types were sales (78.6% or 1,495 of 1,902 transfers). Statewide, the majority (79.6%) of all cross-cohort transfers (regardless of resident type) were also sales. Cross-cohort transfers appear to more likely be transfers between people without a pre-existing relationship and therefore are more likely to be sale rather than gift transactions.

Sources of permit financing are shown in [Table 32](#) for 1,495 purchases where non-local buyers acquired locally-held permits. For all fisheries combined, 66.9% of the permit sales throughout 1980-1994 were financed through the personal resources of the transferee. This figure is higher than the amount of

self-financing used by only Alaska residents (51.0%) and higher than the overall all-resident percentage (56.1%) reported in [Table 22](#);4 however, both tables indicate that since 1980 the use of personal assets to buy permits has increased.

[Table 32](#) also shows the percentage of state-financed loans is less for non-local buyers of local permits (11.8%) than the percentages reported for only Alaskan buyers (27.7%) or all buyers (19.4%) ([Table 22](#)).5

APPENDIX A.

Decision Rules Used to Designate Urban, Rural, Local and Nonlocal

1. Urban includes all towns with 1990 U.S. Census populations of 2,500 or more.
2. Communities are designated urban even though their populations are under 2,500 if they lie within an "urbanized area." Urbanized areas are defined as all communities and places connected by highway to urban centers with populations of 6,000 or more and lying within a 20-mile radius of the urban center (for cities from 6,000 to 20,000 population) or a 40-mile radius (for cities of more than 20,000). The radius is measured from the center of the city as denoted by the city location point on maps, rather than from the city limits. An exception to the radius rule is that the Anchorage "urbanized area" does not extend north of Knik Arm nor south of Turnagain Arm.

The cities of 6,000 to 20,000 population are Ketchikan, Kenai, Kodiak and Sitka. The cities above 20,000 are Anchorage, Fairbanks and Juneau.

Table 1 presents annual counts of year-end permits held by each urban community split into two groups to show the sensitivity of the urban/rural threshold level. If the threshold level were set at a population of 4,000 people instead of 2,500 then the first group of communities would be classified as rural resulting in an additional 1,167 rural permit holders at year-end 1993.

Local/Nonlocal

1. On the coast, local/non-local boundaries are based on Fish and Game salmon management areas. Exceptions include communities which have been within more than one Fish and Game management area as a result of the movement of Fish and Game boundaries since 1975. These communities have been made local to both areas (see below). In addition, Cape Yakataga and Port Heiden are "overlap" areas that can contain more than one assigned permit and management area designation. Residents of these two areas will be local for both relevant overlap areas. Lastly, residences in both Southeast and Yakutat are designated local to the hand and power troll fisheries.

Communities Local to More Than One Alaska Department of Fish and Game Management Area

Community	Local Management Areas	Community	Local Management Areas
Port Heiden	Bristol Bay/ Peninsula Aleutians		
Cape Newenham	Bristol Bay/ Kuskokwim		
Cape Yakataga	Prince William Sound/ Yakutat		
Cape Romanzof	Kuskokwim/ Lower Yukon		
Chevak	Kuskokwim/ Lower Yukon		
Hooper Bay	Kuskokwim/ Lower Yukon		
Igiak	Kuskokwim/ Lower Yukon		
Scammon Bay	Kuskokwim/ Lower Yukon		
St. Michael	Lower Yukon/ Norton Sound		
Stebbins	Lower Yukon/ Norton Sound		

2. The Upper and Lower Yukon and Kuskokwim River fishery areas are based on immediate river drainages. The Lower Yukon area extends up the Yukon River to just above Holy Cross. The Upper Yukon "local" area extends up the Koyukuk tributary as far as Huslia, the Chandalar as far as Venetie and the Tanana to Delta Junction, 30 miles beyond the upper limits of commercial fishing on that river. The Kuskokwim local area extends 30 miles upriver beyond the limit of commercial fishing on that river and includes the Stony River tributary as far as Lime Village and the Holitna River as far as Kasheglok.

3. The Bristol Bay area extends inland up the Nushagak River and includes the entire Tikchik Lake system as well as Lake Iliamna and Lake Clark.

4. The Cook Inlet local area includes all but the eastern edge of the Anchorage Borough. The line dividing the Cook Inlet and Prince William Sound ADF&G regulatory areas is extended inland directly north. That is, the line runs from Cape Fairfield at 148°50'W, north to 61°32'N (just north of Bodenbutte and south of Palmer) and thence west to 150°30'W (to the community of Susitna) and thereafter follows, at a little distance inland, the western shore of Cook Inlet, ending at Cape Douglas.

5. The Prince William Sound area extends up the Copper River to the confluence of the Bremner River. Taking in the census subareas of Prince William Sound and Cordova, but not the Copper River subarea. It excludes the interior Copper River as well as the Edgerton, Richardson and Glenn Highway communities.

6. Localness for the Westward Herring Fisheries is based on ADF&G regulatory districts rather than entire management areas. Herring stocks in Western Alaska are managed and permitted specific to these districts. The local definitions for these fisheries are based on the districts as defined in 1993 ADF&G Commercial Herring Fishing Regulations and extend 30 miles beyond those district boundaries. The districts therein are defined as waters bounded by specified coastline features or latitudes, but the localness includes those population centers on the coast within those boundaries as well as within a 30 mile radius extending inland and beyond the northern and southern district boundaries. Because the Nelson Island and Nunivak Island districts overlap with respect to latitude and because pre-limitation permitting combined these fisheries, they will share the same local communities for the purposes of this study.

TABLE 1, APPENDIX A. Permits Held by Alaska Urban Locals and Non-locals by City and Year, 1975-1994.

* The 1990 U.S. Census is the source of the assigned city populations.
Suburban areas have been assigned the city population figures of adjacent urban communities.

Comparison of Urban/Rural and Local/Nonlocal Standards in this Report with those in Dr. Steve Langdon's Permit Transfer Study

Beginning with the 1990 edition of this report, a population of 2,500 has been used in conjunction with 1990 Census figures for the threshold distinguishing urban from rural. This is the same threshold used by Langdon¹ although he used 1978 population estimates obtained from the Alaska Department of Community and Regional Affairs. owns that differ in urban/rural designations from Langdon's work and this study area:

TOWN	LANGDON	CFEC
Cordova	Urban	Rural
Wrangell	Urban	Rural
Girdwood	Rural	Urban
Nikiski	Rural	Urban
Sterling	Rural	Urban
Unalaska	Rural	Urban

The designation of local fishery areas in this report differs from the version Langdon used in that substantial areas of interior Alaska are declared "nonlocal" to any fishery on the assumption that these areas are not truly economically or traditionally oriented to commercial coastal or river fisheries. Certain offshore islands of the Bering Sea (St. Lawrence, St. George, St. Paul, St. Matthew and Little Diomed) are also "nonlocal" to any commercial fisheries under limitation.

Langdon designated certain villages in the Kuskokwim delta as "local" to both the Kuskokwim and Bristol Bay fisheries, presumably on the basis of customary fishing patterns and initial permit issuance patterns. While there are advantages to this, it suggests that one ought to deal similarly with comparable situations statewide. For the sake of uniformity, no local designations were made across area borders except as noted above.
